

# Human health risks and main concerns of PFAS

Rie Vinggaard, National Food Institute, DTU

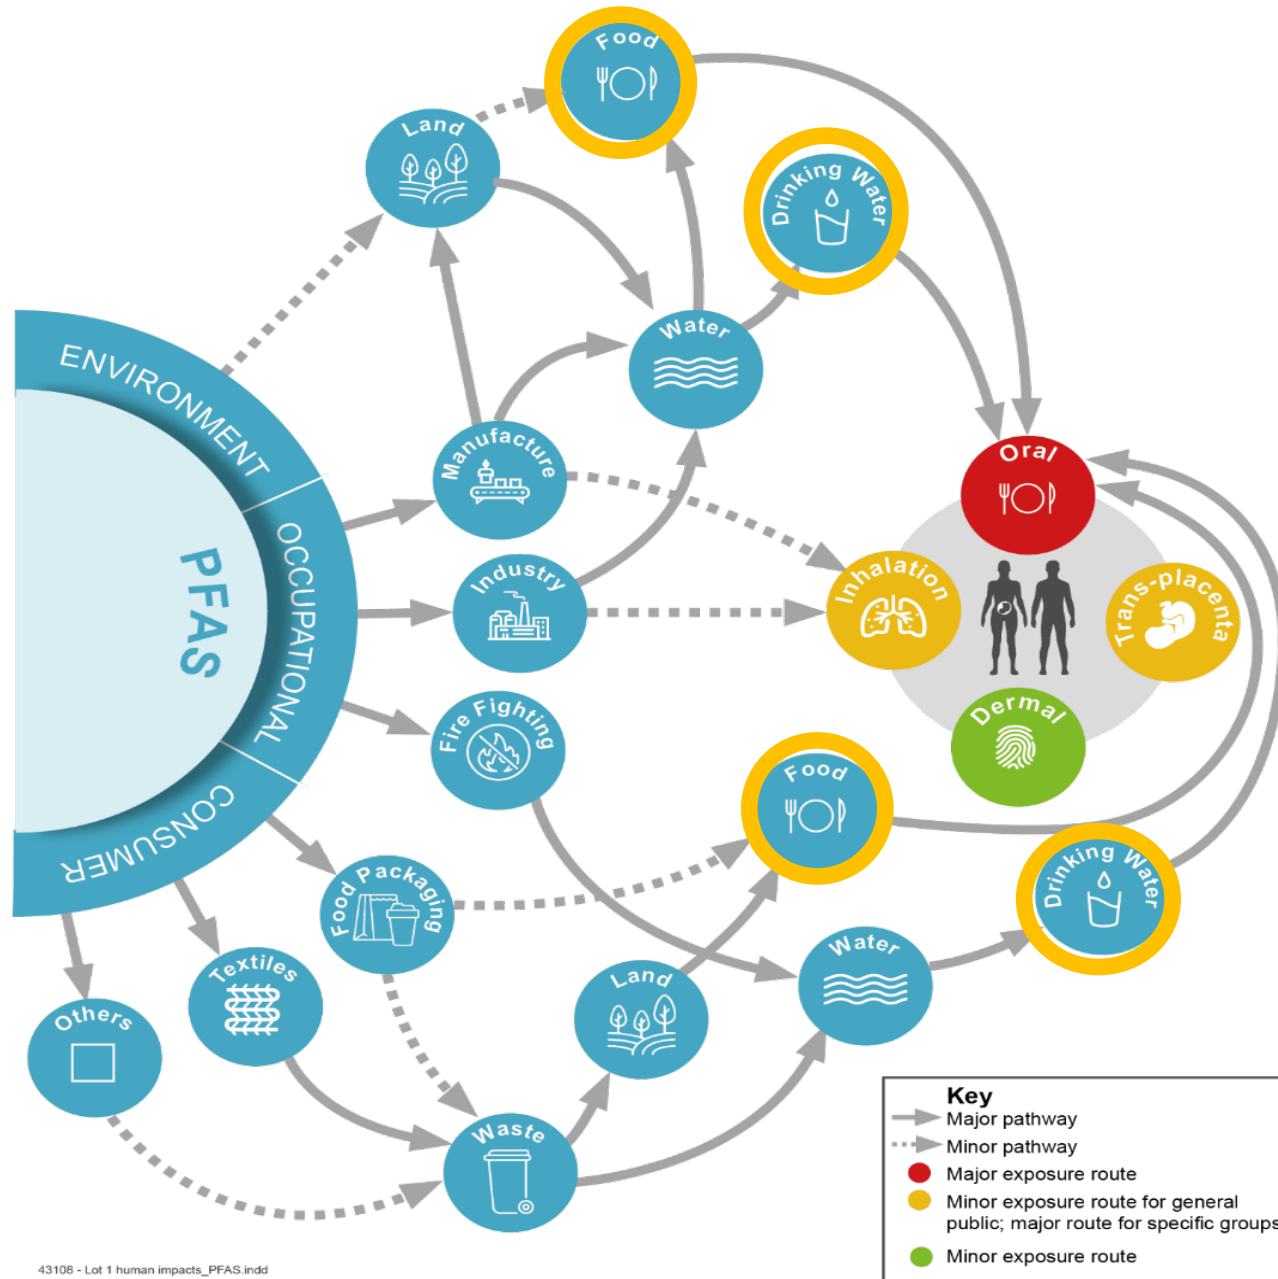

18<sup>th</sup> Sept 2023

Online Nordic meeting

**Which exposure sources?**

**Is the exposure decreasing, increasing or unchanged?**

# Sources of human exposure to PFAS

43108 - Lot 1 human impacts\_PFAS.indd

Ref: HBM4EU Policy brief, 2021

- PFAS – a broad class of **anthropogenic** chemicals
- EPA (2023): **14,000** PFAS
- Extremely **persistent**, some are bioaccumulating

# Diffuse versus 'hot spot' PFAS contamination of the environment

Modified from Espartero et al. Health-related toxicity of emerging per- and polyfluoroalkyl substances: Comparison to legacy PFOS and PFOA. Environ Res 2022

# Exposure sources

**Foods are the main source of human exposure to several PFAS** but variability across populations and PFAS compounds exists

**Drinking water can be the dominating exposure source in contaminated areas ('hot spots')**

**Exposure from dust, personal consumer products, indoor environment and other sources do also play a role**

De Silva et al. PFAS Exposure Pathways for Humans and Wildlife: A Synthesis of Current Knowledge and Key Gaps in Understanding. *Enviro Toxic and Chemistry*, 40 (3), 631-657, 2020

# PFAS in serum from Swedish first-time mothers 1996-2017

Ref: Miaz et al. Environ. Sci.: Processes Impacts, 2020, 22, 1071

# PFAS in breast milk from Swedish mothers 1972-2016

Ref: Nyberg et al. *Environ. Sci.: Processes Impacts*, 2018, 20, 1136

**Drinking water, human blood and breast milk is analyzed for just a few parts per thousand of all PFAS**

**Known PFAS**

**Unknown or not measured PFAS**

**Extractable organic fluor (EOF)**

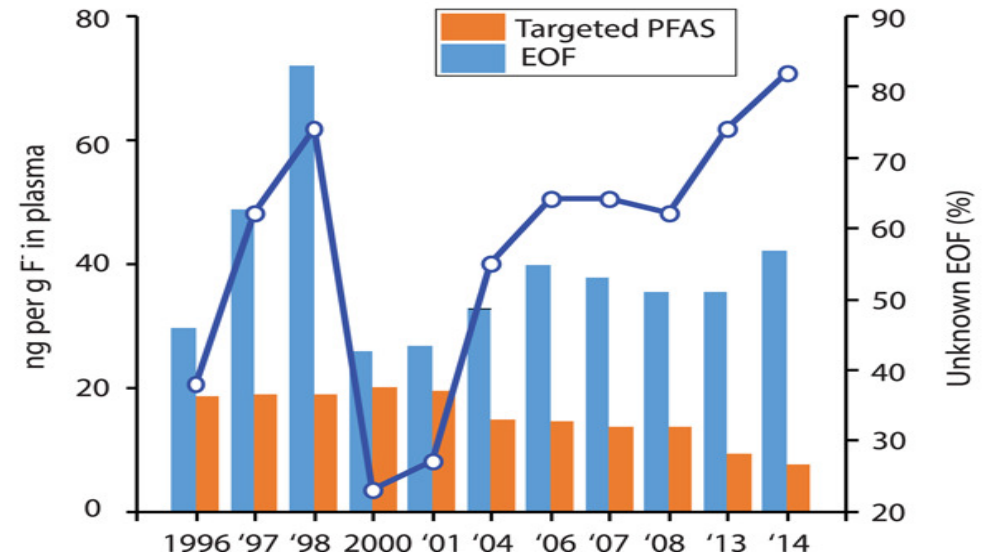

# Legacy PFAS in serum are decreasing, whereas total PFAS does not

(A) Components of the fluorine mass balance

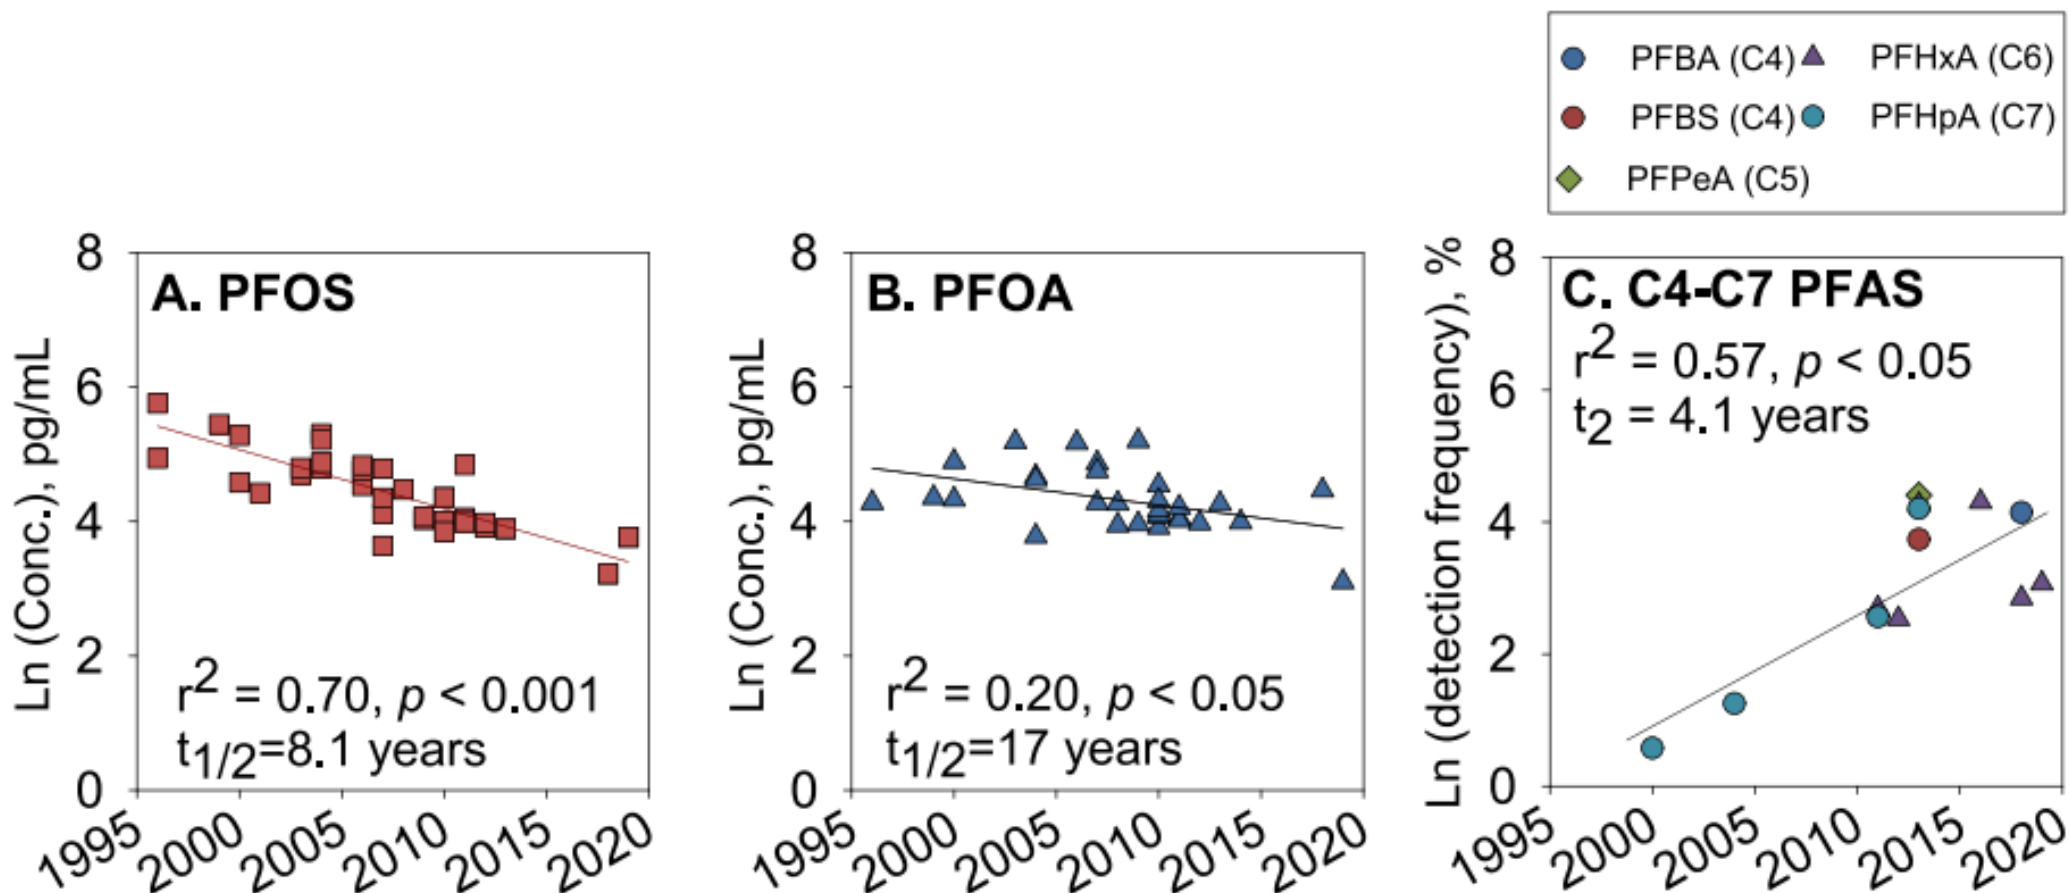

(B) First-time mothers in Uppsala, Sweden exposed to PFAS by AFFF-contaminated drinking water supply

Ref: De Silva et al. *Environmental Toxicology and Chemistry*, 40 (3), 631–657, 2021

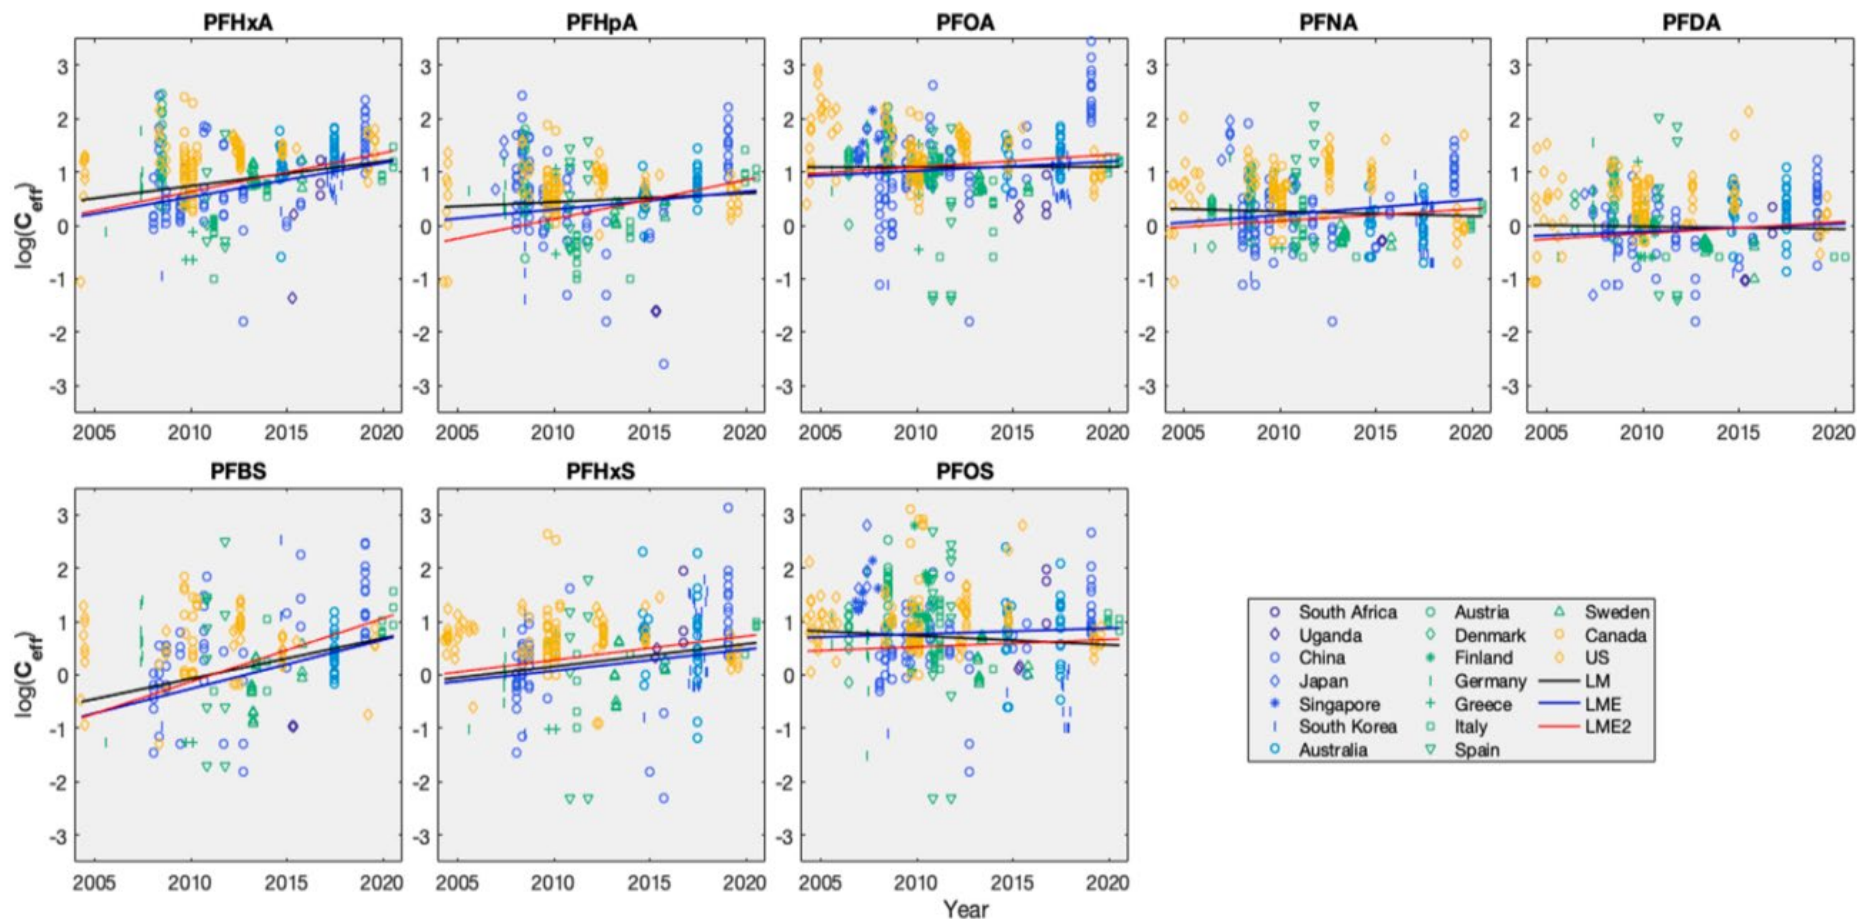

# PFAS in human breast milk in USA 1995-2020

Ref: Zheng et al. Environ. Sci. Technol. 2021, 55, 7510–7520

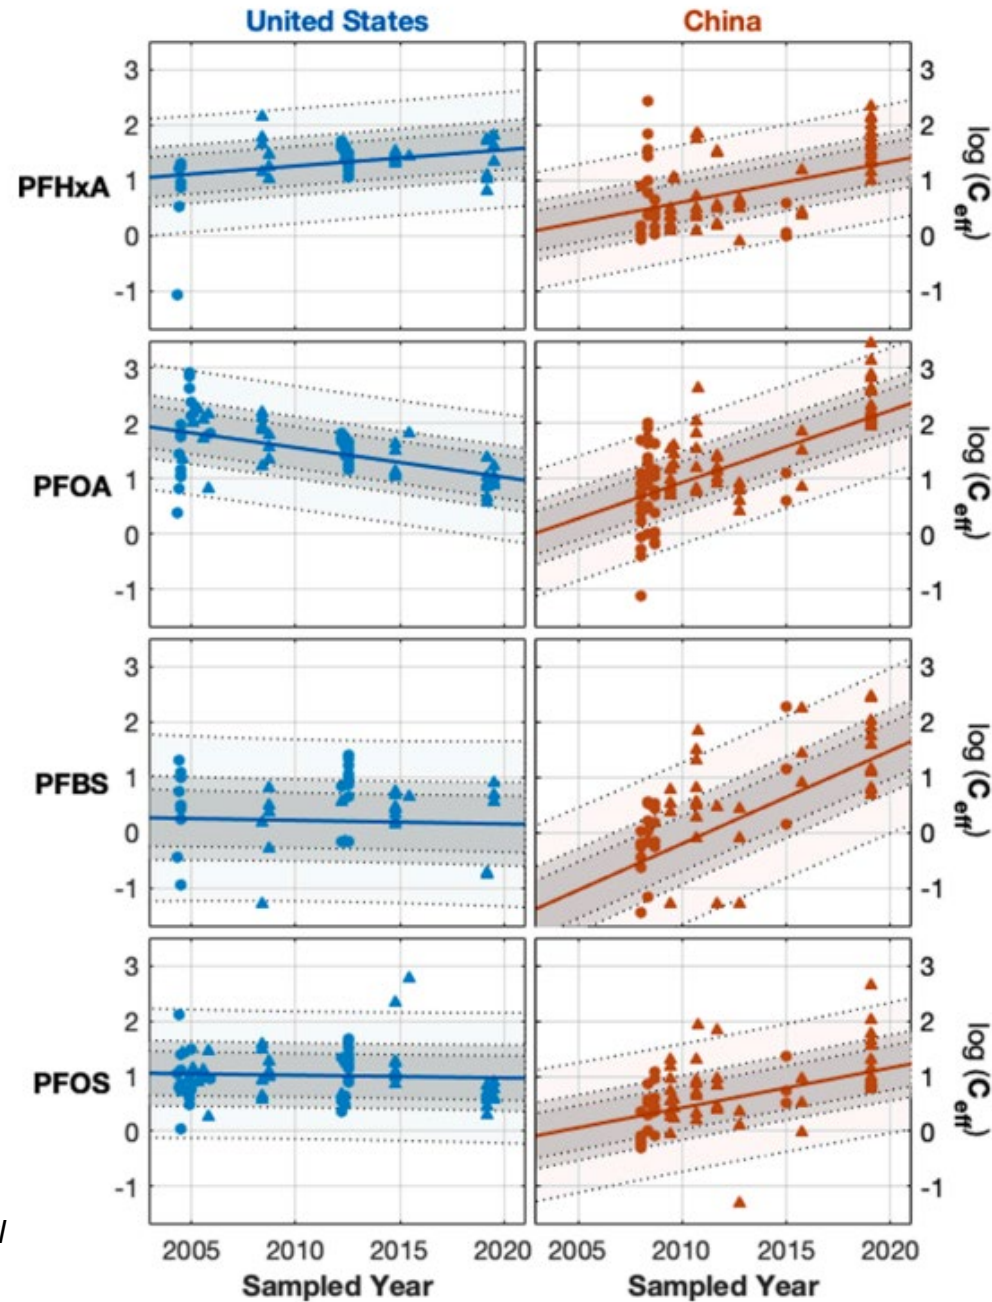

# Global perspective: Time trends of PFAS content in waste-water 2005-2020

Metanalysis of 310 WWTP in 17 countries (44 papers)

Ref: Cookson & Dewiler. Global patterns and temporal trends of perfluoroalkyl substances in municipal wastewater: A meta-analysis. Water Res 2022

# Comparison of PFAS levels in waste-water from US and China

Ref: Cookson & Dewiler. Global patterns and temporal trends of perfluoroalkyl substances in municipal wastewater: A meta-analysis. Water Res 2022

# Time trends of PFAS in biological tissues based on existing knowledge:

**Some legacy PFAS have decreased during the latest couple of decades in the Western world, whereas 'new' PFAS seem to increase**

**In other parts of the World do the legacy PFAS increase**

**Which human health risks?**

**How big is the risk?**

# Effects of PFAS on human health

— High certainty  
 ---- Lower certainty

~0-50% reduced Ab response by a doubling of PFAS exposure

~50-100 gr reduced birth weight

**Critical effects!**

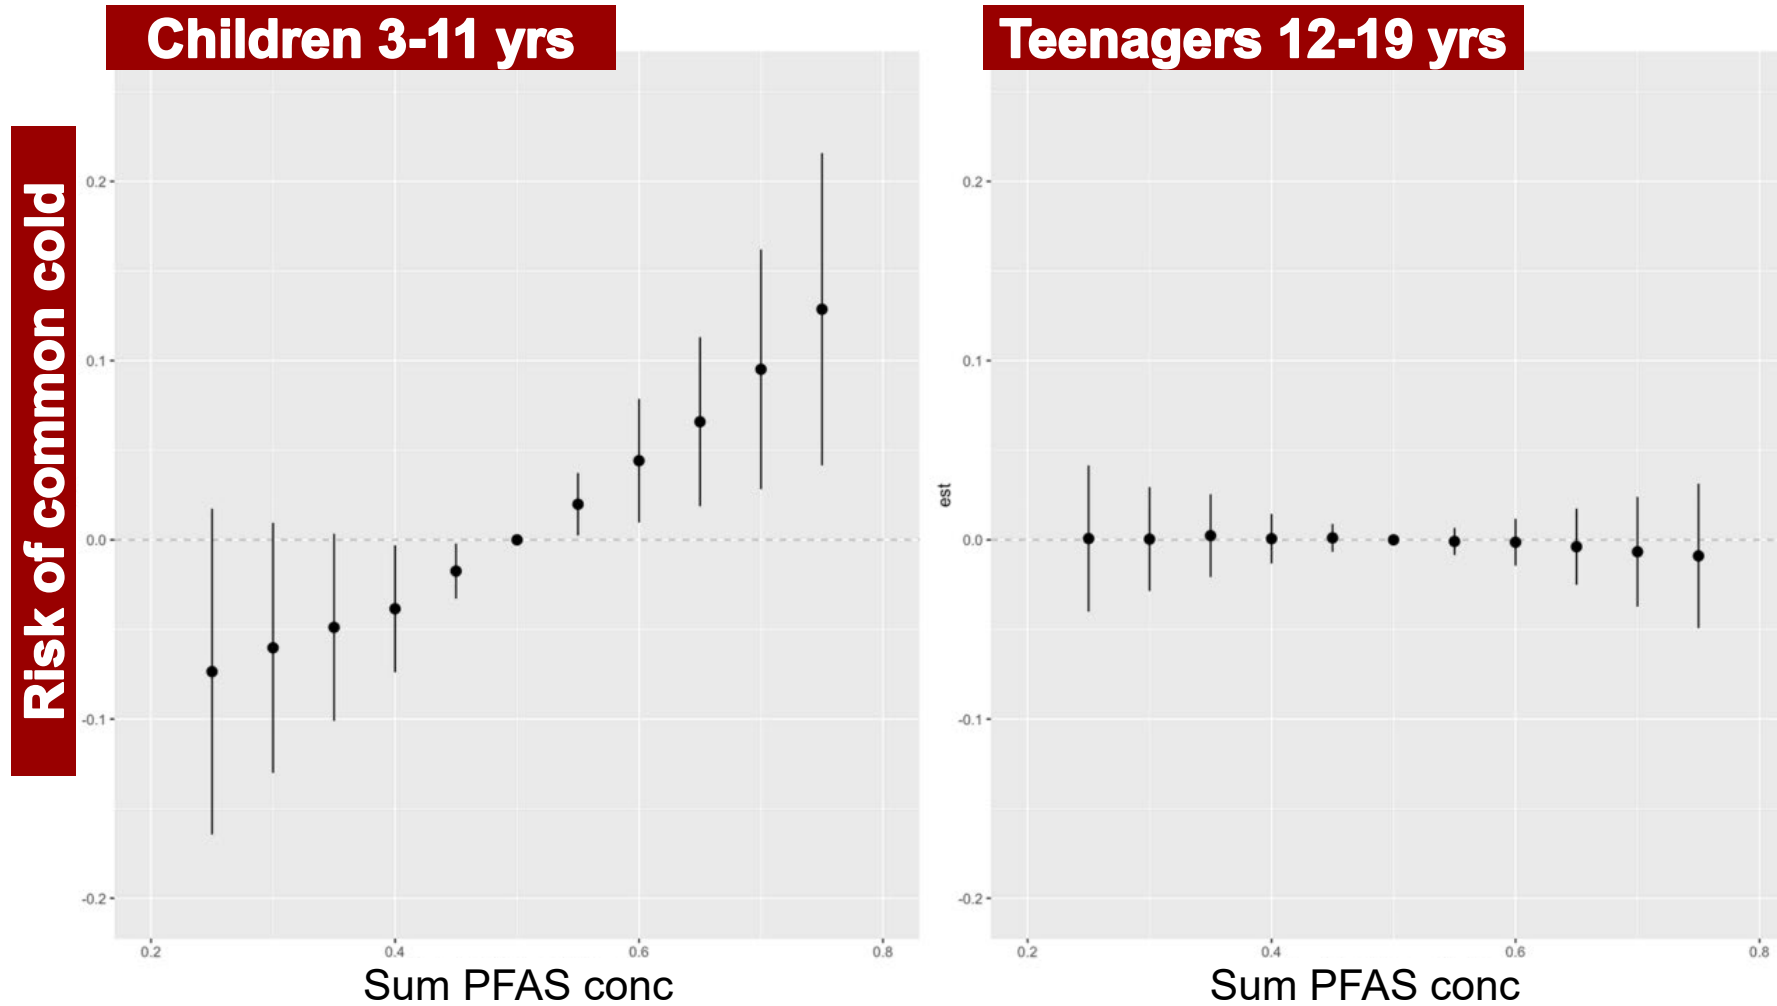

Observed in normal population

Observed in populations from contaminated areas

Observed in rats/mice

Modified from Fenton et al. 2020. Per- and Polyfluoroalkyl Substance Toxicity and Human Health Review: Current State of Knowledge and Strategies for Informing Future Research. Environ Tox Chem

# The risk of common colds increases with increasing PFAS exposure in 3 to 11-year children in the US

Zhang et al. Association between serum per- and polyfluoroalkyl substances concentrations and common cold among children and adolescents in the United States. *Environ Int*, 164, 107239, 2022

# Maternal PFAS and rate of hospitalization for infectious diseases in 1503 Danish children 0-4 yrs

Hazard ratios (HR's) and 95% confidence intervals (95% CI) for the association between maternal PFAS concentrations and the rate of hospitalization for infections (any and according to type)

	Any infection (N = 1472, events = 633)	Interaction, PFAS and child sex, p-value	URTI (N = 1472, events = 167)	LRTI (N = 1472, events = 151)	GI (N = 1472, events = 40)	Other (N = 1472, events = 275)	
	Crude HR <sup>a</sup>	Adjusted <sup>b</sup> HR <sup>a</sup>	Adjusted <sup>b</sup> HR <sup>a</sup>	Adjusted <sup>b</sup> HR <sup>a</sup>	Adjusted <sup>b</sup> HR <sup>a</sup>	Adjusted <sup>b</sup> HR <sup>a</sup>

<sup>a</sup> The change in the instantaneous risk with every doubling of maternal serum PFAS concentration;

<sup>b</sup> adjusted for maternal age, parity, maternal educational level, child sex and child age

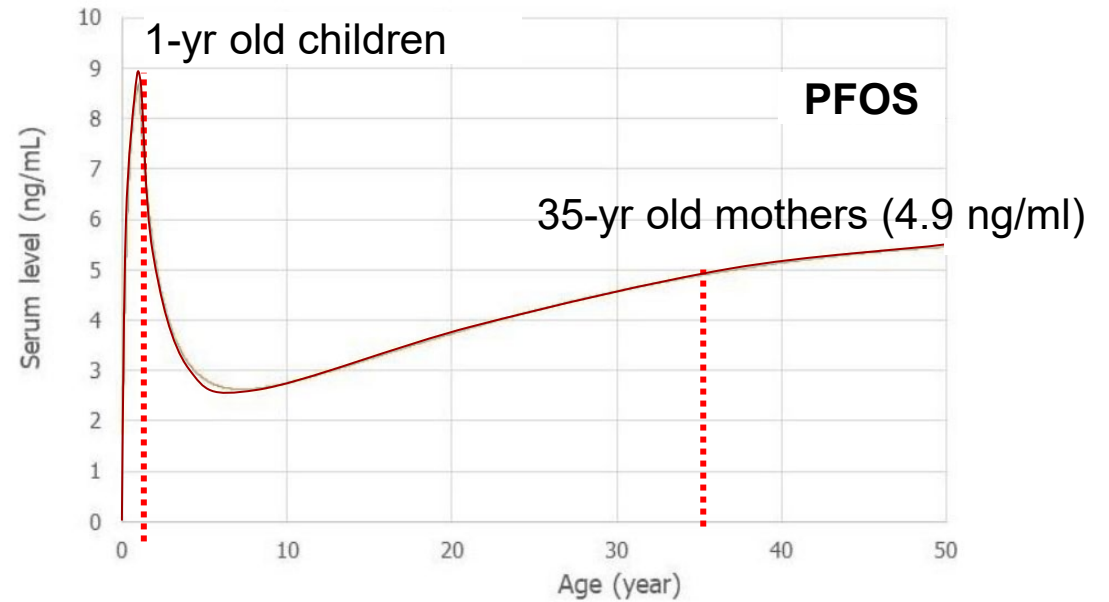

Dalsager et al.: Exposure to perfluoroalkyl substances during fetal life and hospitalization for infectious disease in childhood: A study among 1,503 children from the Odense Child Cohort. *Environ. Int.* April 2021

Tolerable Weekly Intake of  $\Sigma$ 4PFAS  
(PFOA, PFOS, PFNA, PFHxS):  
**4.4 ng/kg body weight/week**  
(EFSA, 2020)

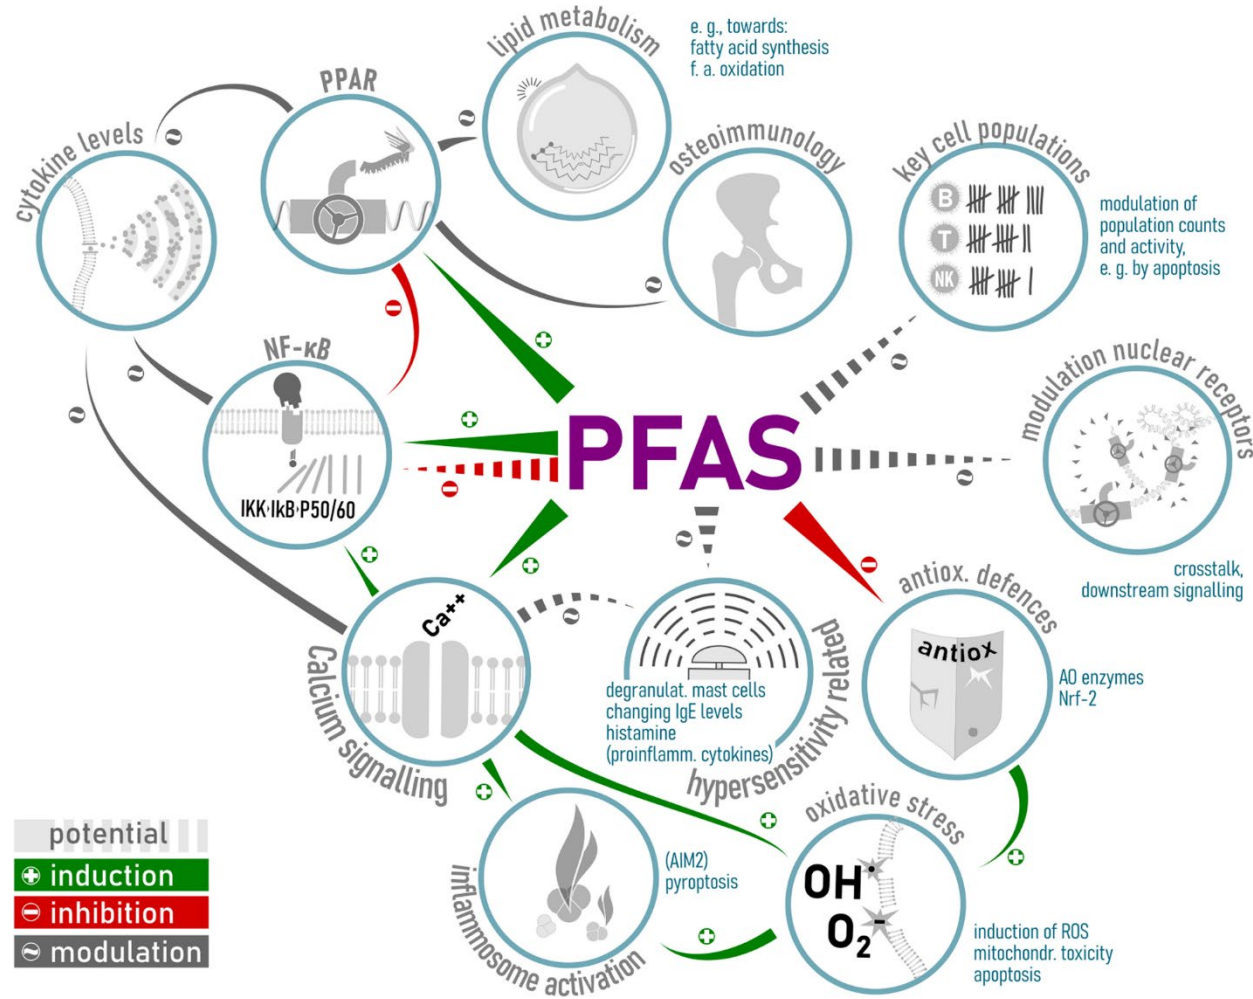

**TWI for 4PFAS is established based on a safe intake for women up till 35-yrs of age, so they can breast feed their children without them being affected by an impaired vaccination response**

# Relevant mechanisms that may underlie the observed effects on the (developmental) immune system

Ehrlich et al. Consideration of pathways for immunotoxicity of per- and polyfluoroalkyl substances (PFAS), *Environmental Health* (2023) 22:19

# Human PFAS intake via foods in the EU is generally too high and must be reduced

<b>Total intake</b> of $\sum 4$ PFAS in the European population:	<b>0.91 ng/kg/day</b>
<b>Tolerable intake</b> of $\sum 4$ PFAS established by EFSA, 2020:	<b>0.63 ng/kg/day</b>

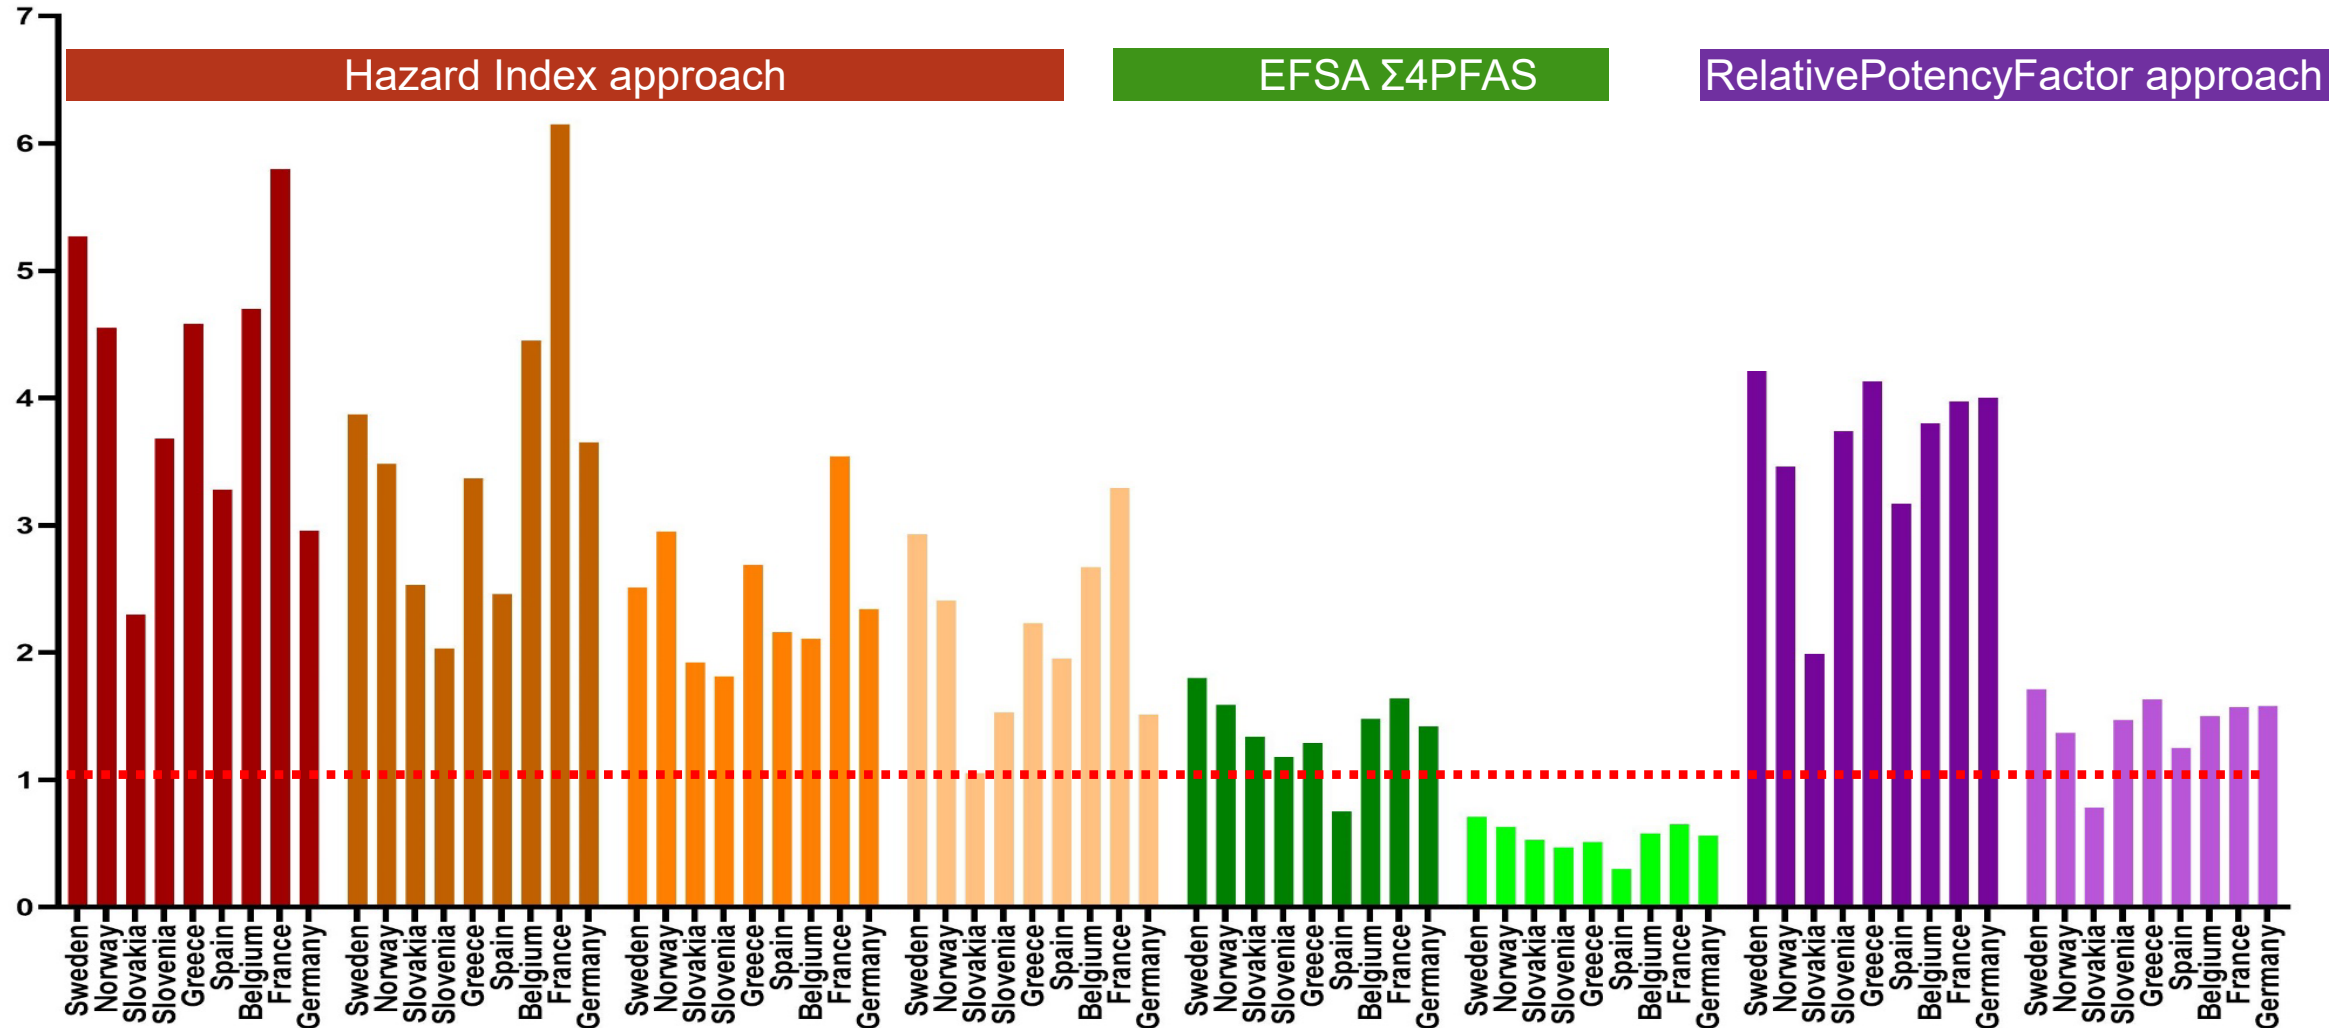

44%  
exceedance

# Risk assessment of PFAS mixtures based on human biomonitoring data from teenagers (P50)

# Risk assessment of PFAS mixtures based on human biomonitoring data from teenagers (P95)

# Conclusions based on existing knowledge

- Some legacy PFAS have decreased in humans during the last 20 years in the Western countries, whereas **new PFAS increase**. In other parts of the World, legacy PFAS increases as well
- **Foods** are the primary source of PFAS exposure in the normal population
- PFAS exposure in the normal population is generally **too high and must be reduced**
- **Impaired vaccination response**, reduced birth weight, and increased cholesterol levels are the critical effects
- Risk assessments are undertaken to protect the entire population. There is **not necessarily a risk for highly exposed individuals**
- However, from a societal perspective **it is NOT acceptable being exposed to PFAS to a degree that affect the unborn child**
